ON SPECIMENS of *RANA RIDIBUNDA* PALLAS, 1771 (Anura: Ranidae) COLLECTED FROM YAĞMAPINAR (Karapınar-Konya)

Murat TOSUNOĞLU, Dinçer AYAZ¹, Bayram GÖÇMEN

ABSTRACT

In this study, 22 adult (10 ♂♂, 12 ♀♀) *Rana ridibunda* specimens were investigated morphologically. The morphological characteristics of the Yağmapınar specimens are in accordance with those given for *R. r. caralitana*. Furthermore, the distribution range of *R. r. caralitana* has now been extended.

Key Words: *Rana ridibunda caralitana*, Morphology, Distribution.

YAĞMAPINAR (Karapınar-Konya)'dan TOPLANAN *RANA RIDIBUNDA* PALLAS, 1771 (Anura: Ranidae) ÖRNEKLERİ HAKKINDA

ÖZ

Bu çalışmada, 22 ergin (10 ♂♂, 12 ♀♀) *Rana ridibunda* morfolojik olarak incelenmiştir. Yağmapınar örnekleminin morfolojik karakterleri *Rana ridibunda caralitana* için verilen karakterlerle uyum içindedir. Ayrıca, *R. r. caralitana*'nın dağılışı genişletilmiştir.

Anahtar Kelimeler: *Rana ridibunda caralitana*, Morfoloji, Dağılış.

1. INTRODUCTION

Rana ridibunda was described for the first time from Guryev in Kazakhstan [Terra typica restricta (Mertens and Wermuth, 1960)] by PALLAS in 1771. The species of *Rana ridibunda* is spread over central and southern Europe and western Asia. *Rana*

ridibunda has been represented as two subspecies (*R. r. ridibunda*, *R. r. perezi*) until 1974. After the acceptance of the subspecies *perezi* as a separate species (*Rana perezi*) (Hotz, 1974), it became a monotypical species.

Recently, lake frogs in Greece, formerly classified as *R. ridibunda*, have been reclassified as three species *R. ridibunda*, *R. epeirotica* and *R. balcanica* (Schneider et al., 1984; Schneider et al., 1993).

R. ridibunda is also widespread in Turkey. According to Bodenheimer (1944) and Başoğlu and Özeti (1973), it is a homogenous species in Turkey. However, although Bodenheimer (1944) has recorded specimens which had orange coloured venters from Beyşehir Lake, these were accepted as belonging to the nominate subspecies without a detailed investigation. Later, Arıkan (1988) found significant differences especially in the pattern and coloration of the venters of the Beyşehir Lake specimens and described the population as a new subspecies (*R. r. caralitana*). Later, the same race was reported from Eğirdir and Suğla lakes, from the tributaries of the Çarşamba creek, from Gölcük (İsparta) and Çivril (Denizli) in the west, foot of the taurus Mts in the South and İvriz (Eregli/Konya) in the east (Atatürk et al., 1990; Arıkan et al., 1994; Arıkan et al., 1998; Budak et al., 2000).

In 1992, Schneider et al., named the marsh frogs from the southwestern parts of Asia, including the western Turkey, as *Rana levantina*, utilizing voice analysis methods. The same was later changed to *R. bedriagae* Camerano, 1882 considering the priority rule (Beerli, 1994; Dubois and Ohler, 1994). Sinsch and Schneider (1999) and Schneider and Sinsch (1999) asserted that the temperate western and southern parts of Anatolia is inhabited by *R. bedriagae*, while the presence of the same in the mountainous regions of northern Anatolia is debatable, so the presence of *R. ridibunda* at these regions is a possibility. But according to Beerli (1994), Jdeidi et al. (1998) and Jdeidi et al. (2001); Anatolia is inhabited solely by *R. bedriagae*. Jdeidi et al. (2001), extended the range of the *caralitana* form to include Çardak-Denizli region and inserted this form under *R. bedriagae*, but also stressed the point that since the *caralitana* form and *R. bedriagae* were found sympatrically at Akşehir and Çardak, it is possible to regard *caralitana* as a distinct species.

On the other hand, Plötner et al. (2001) stated that Anatolian marsh frogs do not represent *Rana bedriagae* according to mitochondrial DNA techniques. However, *caralitana*, the subspecies of *Rana ridibunda* was accepted as *Rana bedriagae* by Kaya et al. (2002).

In the present work, the specimens collected from Yağmapınar (Karapınar-Konya) were evaluated biometrically and from the viewpoint of their pattern and coloration characteristics.

2. MATERIAL and METHOD

2.1. Material List

ZDEU 32/2001, 1-22, (10 ♂♂, 12 ♀♀), Yağmapınar (Karapınar-Konya), 23.06.2001, Leg. M. Tosun-

oğlu, D. Ayaz & B. Göçmen.

The specimens examined in this study were made up of a total of 22 specimens (10 ♂♂, 12 ♀♀) and are deposited in ZDEU (Zoology Department, Ege University). Pattern and coloration features of the specimens were recorded while the animals were alive, and then killed by ether within a sealed container. Next a fixation fluid containing 3 cc 40% formaldehyde, and 97 cc 70% ethanol was injected into the abdominal cavity of the animal. They were then put into 70% ethanol for permanent preservation. The morphometrical measurements were taken with a digital caliper of 0.01 mm sensitivity.

3. RESULTS and DISCUSSION

The specimens used in this study were sexually mature individuals. No differences between the sexes, so the data from both sexes were pooled.

The morphometric measurements and some ratios derived from these measurements are given in Table 1.

In all the specimens examined, the ground coloration of the dorsal was various hues of green and brown. The ground coloration of the whole ventral, including the extremities and the head, was dirty white, and it was more or less covered with orange maculations.

The pattern types of the specimens of *Rana ridibunda* from Yağmapınar (Karapınar-Konya) are given in Table 2, Figure 1 (Dorsal A, B) and Figure 2 (Ventral A, B).

Subsequent studies (Atatürk et al., 1990; Arıkan et al., 1994; Arıkan et al., 1998) have extended the distribution area of *R. r. caralitana*. According to the morphological features, especially from the viewpoint of the pattern and coloration characteristics of their ventral, our specimens from Yağmapınar (Karapınar-Konya) are almost identical with *R. r. caralitana* (Arıkan et al., 1988; Atatürk et al., 1990; Arıkan et al., 1994; Arıkan et al., 1998).

Although the presence of the studies (Beerli, 1994; Jdeidi et al., 1998; Jdeidi et al., 2001; Kaya et al., 2002) which accept Anatolian marsh frogs as *Rana bedriagae*, we have confidence, as mentioned by Plötner et al. (2001), more detailed studies should be done to explain the phylogenetic relations of Anatolian marsh frogs.

Consequently, the present known distribution range of this subspecies has been extended north-east to include Yağmapınar (Karapınar-Konya) in addition to the known range of lake Beyşehir (its terra typica), İvriz-Eregli (Konya), Lakes Eğirdir, Suğla, Gölcük (İsparta), Işıklı (Çivril), and Hotamış.
